CSE 2110 Procedural Programming 1

OddSum:

No error message.

Added an extra odd number

It happened because if the user entered a whole number that was even it would go 1 more odd number past the number. (Ex. User enters 20 program goes to 21)

I added the -1 at the end of the 2nd line in the screenshot which made it stop before it went over the number if the user entered an even number.

```
//Getting and adding all odd numbers up to the number entered by user
while (minNumber < maxNumber - 1)
```
